

# Your Genome: What do you want to know? And what *don't* you want to know?

Thursday, April 16, 7 p.m.

Motorco, 723 Rigsbee Ave, Durham, NC 27701

It has been just over a decade since the human genome was sequenced, and genomics is beginning to make its way into the most personal aspects our lives. Its application will have many benefits for disease prevention and personalizing medical treatment. However, in a broader context, genomic analysis may eventually inform knowledge of behavioral traits, such as the proclivity for depression, religiosity, or anti-social behavior.

Some of these data will be helpful, most will be mysterious, and some will reveal information that many individuals may wish not to know. This session will be an open discussion to explore how genomics can contribute to society but also create new risks and challenges.

James P. Evans, MD, PhD, is the Bryson Distinguished Professor of Genetics and Medicine at The University of North Carolina at Chapel Hill.
